Multimodal visual understand + Depth Camera Distance Question Answering(Text Version)

1. Course Content
2. Preparation
 - 2.1 Content Description
3. Running the Example
 - 3.1 Starting the Program
 - 3.2 Test Cases
 - 3.2.1 Case 1: "Please tell me the distance between the fan in front of you and you."
4. Source Code Parsing
 - 4.1 Example 1

1. Course Content

1. Learn to use the robot's visual feedback to determine the distance to an object.
2. Analyze newly discovered key source code.

2. Preparation

2.1 Content Description

This course uses the Raspberry Pi 5 as an example. For Raspberry Pi and Jetson Nano boards, you need to open a terminal on the host computer and enter the command to enter the Docker container. Once inside the Docker container, enter the commands mentioned in this course in the terminal. For instructions on entering the Docker container from the host computer, refer to **[01. Robot Configuration and Operation Guide] -- [5.Enter Docker (For JETSON Nano and RPi 5)]**. For Orin boards, simply open a terminal and enter the commands mentioned in this course.

 This example uses `model: "qwen/qwen2.5-vl-72b-instruct:free", "qwen-vl-latest"`

 The responses from the large model may not be exactly the same for the same test command and may differ slightly from the screenshots in the tutorial. To increase or decrease the diversity of the large model's responses, refer to the section on configuring the decision-making large model parameters in the **[03.AI Model Basics] -- [5.Configure AI large model]** .

 It is recommended that you first try the previous visual example. This example adds voice functionality to the singleton example. The functionality is largely the same, so I will not further debug the program or describe the results in detail.

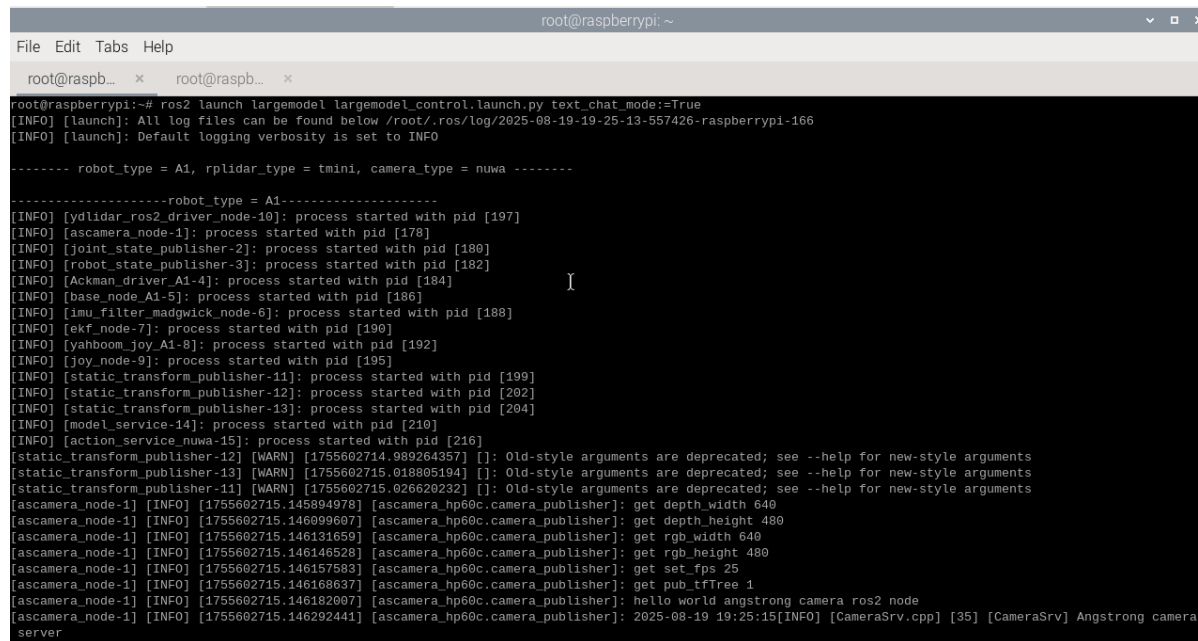

3. Running the Example

3.1 Starting the Program

For Raspberry Pi 5 and Jetson Nano controllers, you must first enter the Docker container. For the Orinboard, this is not necessary.

Open a terminal in Docker and enter the following command:

```
ros2 launch largemodel largemodel_control.launch.py text_chat_mode:=True
```

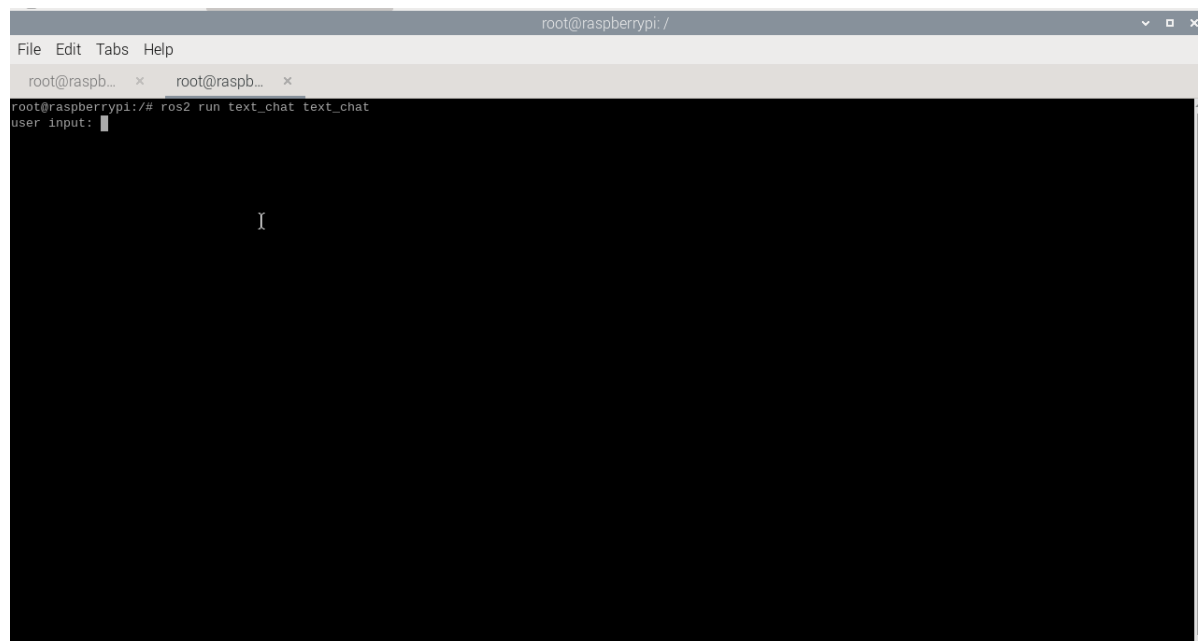

```

3.2 Test Cases

Here are two reference test cases; users can create their own test commands.

- Please tell me the distance between the object in front of you and you.

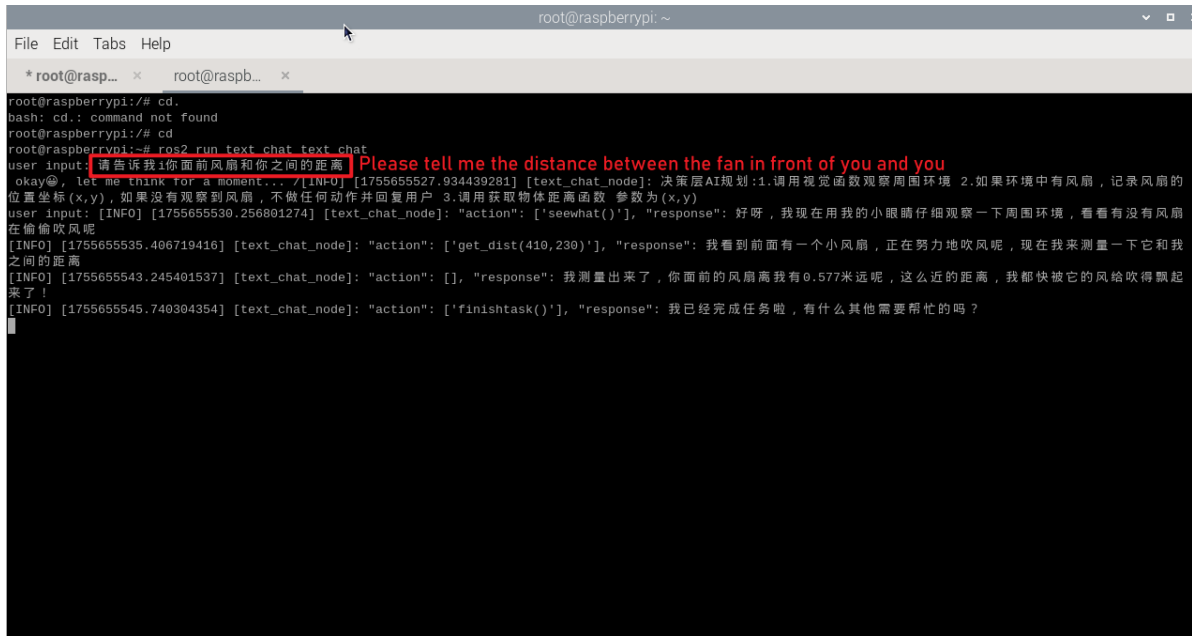

Example: Please tell me the distance between the fan in front of you and you.

⚠ Please do not end the text with a period or any other characters!

3.2.1 Case 1: "Please tell me the distance between the fan in front of you and you."

Type "Please tell me the distance between the fan in front of you and you." The terminal prints the following information.

You can see that the terminal responds with a distance of 0.577 meters. **(Note: If the feedback is 0.0 meters, it may be because the object being recognized is too small, resulting in inaccurate center coordinates from the large vision model. This can be resolved by changing the vision model and the recognized object.)**

A window titled **frame** will open on the VNC screen and automatically close after 4 seconds.

The other terminal will print the object's center coordinates and distance information.

```

After completing a task, the robot enters a waiting state. Pressing the **ENTER** key allows you to continue the conversation. The command you entered is directly passed to the execution layer model, and all conversation history is retained. You can enter the **"End current task"** command again to terminate the current task cycle and start a new one.

4. Source Code Parsing

Source code located at:

Jetson Orin Nano host:

```
#NUWA camera user
/home/jetson/yahboomcar_ros2_ws/yahboomcar_ws/src/largemodel/largemodel/action_service_nuwa.py
#USB camera user
/home/jetson/yahboomcar_ros2_ws/yahboomcar_ws/src/largemodel/largemodel/action_service_usb.py
```

jetson Nano, Raspberry Pi host:

You need to enter Docker first.

```
#NUWA Camera User
/root/yahboomcar_ros2_ws/yahboomcar_ws/src/largemodel/largemodel/action_service_nuwa.py
#USB Camera User
/root/yahboomcar_ros2_ws/yahboomcar_ws/src/largemodel/largemodel/action_service_usb.py
```

4.1 Example 1

action_service.py Program:

Example 1 uses the **seewhat** and **get_dist(self,x,y)** methods in the **CustomActionServer** class.

- The **seewhat** function primarily obtains the color image from the depth camera.
- The **get_dist(self,x,y)** function performs color tracking.
- **dist_callback()** receives the distance callback function

Here we mainly explain the **get_dist(self,x,y)** function. This function requires input parameters x and y, representing the center coordinates of the distance to be obtained.

Subscribe to the feedback distance

```
self.dist_sub =
self.create_subscription(Int32, 'dist_topic', self.dist_callback, 10)
```

Deep Distance Question and Answer Subprocess

```
在偷偷吹风呢
[INFO] [175565535.406719416] [text_chat_node]: "action": ['get_dist(410,230)'], "response": 我看到前面有一个小风扇，正在努力地吹风呢，现在我来测量一下它和我之间的距离
```

```
# Start the Deep Distance Question and Answer subprocess
process_1 = subprocess.Popen(['ros2', 'run', 'yahboomcar_voice_ctrl_depth',
['voice_get_dist', '--ros-args', '-p', f'x:={x1}', '-p', f'y:={y1}']])
```

The startup program source code path is:

```
~/yahboomcar_ros2_ws/yahboomcar_ws/src/yahboomcar_voice_ctrl_depth/yahboomcar_voice_ctrl_depth/voice_get_dist.py
```

```

def get_dist(self,x,y):
    self.get_dist_future = Future() #Reset the Future object
    x1 = int(x)
    y1 = int(y)
    process_1 = subprocess.Popen(['ros2', 'run', 'yahboomcar_voice_ctrl_depth',
    'voice_get_dist', '--ros-args', '-p', f'x:={x1}', '-p', f'y:={y1}'])
    while not self.get_dist_future.done():
        if self.interrupt_flag:
            break
        time.sleep(0.1)

    self.kill_process_tree(process_1.pid)
    self.cancel()

```

Wait for the callback function to feedback the distance and send the future.done signal. Then the `while not self.get_dist_future.done()` in the **dist_callback** function will exit the blocking state. Then the **kill_process_tree** method will be called to recursively kill the process tree of the child process. Finally, the status of the execution action will be fed back to the execution layer model.
